## CERTIFICATIONS

## OBJECTIVE

Implement the whole set of knowledge that I been getting through my years of professional career into the IT industry to make the companies where I work on to get bigger and to achieve its goals

---

## SKILLS

I'm good coding. Because of this and also because I like to code it isn't difficult for me to learn new programming languages. Also, I'm a self-learner

---

## EXPERIENCE

### HCL TECH

05/2017 – Current

Worked on a System Team as a Nearshore and offshore lead siting in the client location, my activities in this team are:

- Run standups
- Coordinate over different team effort to achieve team goals
- Provide java trainings to team members.
- Help in the story writing process
- Help writing the acceptance criteria for new tasks.
- Assist in the management and reporting tasks.
- Assist in the PI planning.
- Help in the innovation and improvement for process.
- Attend Hub Calls with all regions lead to provide status of my segment
- Plan and provide trainings to new joiners
- Evaluate 1<sup>st</sup> round interview for new candidates

I've worked in the projects listed below:

### Automation Self servicing tool;

my team and I were working on creating Automation scripts to validate the main happy paths of the applications we serve. In addition to this

I won a hackathon idea, and I was the responsible to implement the idea. This was for an automation self-servicing tool, the main technologies used for this were: **Selenium, TestNg, SauceLabs, Java, spring boot (to create the REST API), React Js, React-Redux, React-Router, Js (ES6), Axios.**

### ETL Refactor and Migration Jobs

Also participate in a migration of ETL Data Stage jobs into a new standard called E3. Also, I help in the effort of migrating this Jobs by improving the logic and implementing the VCS into the Git-lab to add Version control capability and a CI process with IBM UCD.,

during this phase, we had to coordinate with another team.

For this the technologies we were applying were **IBM Data Stage** (Jobs creation), Unix Server that contains the folder structure according to the **E3 framework, Shell scripting**.

Innovation, I've proposed to create an application where to centralize the DB's details for our area due to a bunch of impediments and blockers we had which were well accepted from clients, this development is in the initial phase.

For this new development I had done the design, the story writing, and the initial work for the front end (React), API (REST), still pending the DB connection

The Technologies implemented in this project are:

**ReactJs, Axios, Springboot for the API**

Another innovation I've propose were to update a file handler jar logic.

For this I've suggested upgrade legacy code into java 8.

For this project the technologies used where **Java 8, Junit with mocking (Power mock, and mockito), gradle, Shell scripting**.

#### **Refactor of legacy service**

Help on a legacy internal application migration. This application is an old SOAP services-based web services, the refactor consists of migrate this SOAPS services into REST services, for this the technologies used were:

**Java, REST web services, TALON – Open-shift, React Js, React Router, React Redux, Js ES6**

#### **Worked on an automation team.**

My team and I were working on creating a standardized testing framework. The main technologies we were applying was **Selenium, TestNg, Java Se, and Saucelabs**.

My roles were lead an offshore team, write code, attend meeting with offshore people to clarify tasks.

Worked as a java trainer. My role in this task was design, organize and teach the java content to a QA group.

### **GREAT LOGICS**

12/2016 – 05/2017

Worked on a java development team. My team and I worked on a HR internal Control management system.

The technologies used for this project were. Java EE with the Spring web and Spring core framework.

For the data base we implemented the **ORM Hibernate** following the **DAO** pattern and the **JPA**.

for the web services we implemented the **REST** architecture and the JSON for the responses.

For the testing we used **Junit** and **SoapUI**

### **WIPRO**

06/2016 – 12/2016

Worked on a ETL development team. My team and I worked on a system that extract and transform data from container to the specific format the client required. The main technologies for this project were:

**Teradata** as a database container,

**DML** instructions to manipulate the information,

**AB-initio** as the BI tool to manipulate the data.

### **TATA CONSULTANCY SERVICES**

04/2014 – 06/2016

Support to production and development environment

The main technologies we were using in this project were **JSP, HTML5, CSS, JPA, ORM Hibernate, DAO pattern**.

Used **JSON** for the web service responses

Reviewing test cases and bug fixing,

Used java core concepts such as Collection Framework and Interfaces

As a free time I'm currently working on personal projects using the Ethereum block

chain, also I'm training my-self on machine learning, apart from this currently I'm building a couple of apps using react native.

## EDUCATION

**BS COMPUTER SCIENCES / 01/2014**

TecNM campus Cd. Guzman

## VOLUNTEER EXPERIENCE OR LEADERSHIP

Volunteer at [www.code.org](http://www.code.org)
